Flexible Mobile Managed Services to keep your employees connected and productive.

Enterprise Mobile Managed Services Modular provides an efficient, flexible and cost-effective way to access your company applications and data.

Managing a fleet of modern smart devices creates complexity for businesses with many endpoint variants, operating systems and customer data to deploy and secure. It's difficult to keep pace with rapid change and support your staff, while trying to ensure the best user experience possible and effectively managing operational expenses.

Mature "Mobile First" companies are looking to increase business productivity through implementing a wholistic mobile managed service. Combining great devices, plans, staff support, security, compliance and visibility of usage through reporting, makes it simple for staff to be successful and improve customer engagement.

Having the ability to support your staff when things go wrong is imperative to a successful business. That's why Telstra provides a local point of presence to help your end users at the front line using experienced mobility specialists to keep you on track and professional & managed services to assist in designing and maintaining your unified endpoint environment.

With Telstra Enterprise Mobile Managed Service, we will design, build and implement the tools, technology and processes that form the critical framework of managing your device fleet.

From designing the right architecture, project managing the implementation, defining your security policy and threat detection, device procurement and repairs, platform management and local 24/7 end user support. These services are available to be purchased in a bundle or individually as modular services providing flexibility to help support your business needs.
